Wikiprint Book

Title: 1. IPSLCM6 model

Subject: Igcmg_doc - Doc/Config/IPSLCM6_rc0

Version: 56

Date: 07/03/24 20:38:11

Table of Content

IPSLCM6 configurations

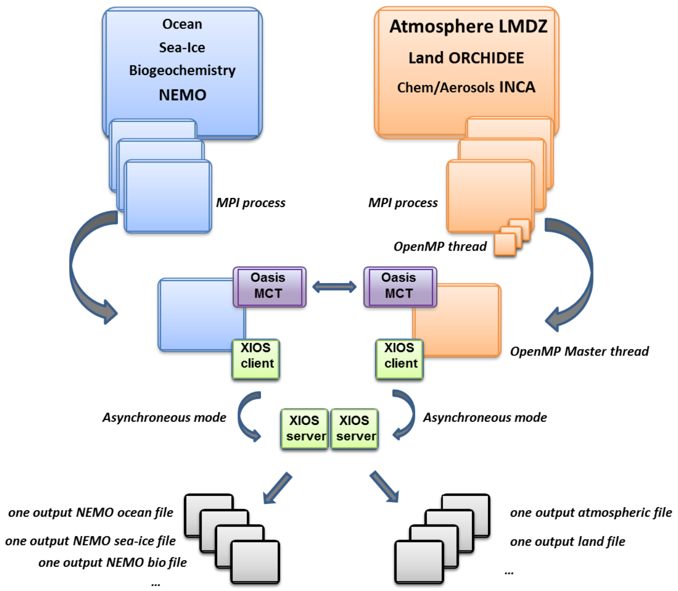
Person in charge: Arnaud Caubel

1. IPSLCM6 model

IPSLCM6 is **the IPSL coupled climate model** under development for the CMIP6 simulations including atmosphere, land, ocean, sea ice and carbon cycle. This model includes :

- model components :
  - **LMDZ** as atmospheric model ;
  - **NEMO** as ocean model including sea ice (LIM2/LIM3) and marine biogeochemistry (PISCES) ;
  - **ORCHIDEE** as land model ;
- tools :
  - **OASIS3-MCT** as parallel coupler ;
  - **XIOS** as I/O library ;
  - **libIGCM** as running environment (scripts) to run the model and to perform post processing ;

This model runs on **Curie-TGCC** and **Ada-IDRIS**.



2. Resolutions and configurations

IPSLCM6 model will be available at different resolutions/configurations :

- **IPSLCM6A-VLR_rc0** : LMDZ(Old Physics) 96x95x39-ORCHIDEE(Choisnel) - NEMO-LIM2-PISCES ORCA2
- IPSLCM6-LR (under development, not available) : LMDZ 144x144x79-ORCHIDEE - NEMO-LIM3-PISCES ORCA1xL75

2.1. IPSLCM6A-VLR_rc0

The resolution of LMDZ is 96x95 (3,75° in longitude and 1,875° in latitude) with 39 vertical levels. The ocean configuration is ORCA2 : global ocean with a tripolar grid with one South pole, one North pole above Siberia and one North pole above northern America. The resolution is 2°. In the tropical region, the latitudinal resolution decreases to 1/2°. There are 31 vertical levels.

IPSLCM6-VLR_rc0 is composed of following components and tools :

```
#-H- IPSLCM6_rc0  IPSLCM6_rc0 coupled configuration
#-H- IPSLCM6_rc0  Working configuration started 17/04/2013
#-H- IPSLCM6_rc0  with 5 NEMO sub-domains
#-H- IPSLCM6_rc0  NEMOGCM trunk revision 4859
#-H- IPSLCM6_rc0  XIOS branch xios-1.0 revision 592
#-H- IPSLCM6_rc0  IOIPSL/src svn tags/v2_2_2
#-H- IPSLCM6_rc0  LMDZ5 LMDZ6_rc0 branch revision 2283
#-H- IPSLCM6_rc0  ORCHIDEE version trunk rev 2247
#-H- IPSLCM6_rc0  OASIS3-MCT 2.0_branch rev 1129
#-H- IPSLCM6_rc0  IPSLCM6 v6_rc0 svn
#-H- IPSLCM6_rc0  libIGCM trunk 1174
#-M- IPSLCM6_rc0  arnaud.caubel@lsce.ipsl.fr
#-C- IPSLCM6_rc0  IOIPSL/tags/v2_2_2/src                    HEAD       8  IOIPSL/src     modeles
#-C- IPSLCM6_rc0  trunk/ORCHIDEE                            2247      14  ORCHIDEE       modeles
#-C- IPSLCM6_rc0  branches/OASIS3-MCT_2.0_branch/oasis3-mct 1129      15  oasis3-mct     .
#-C- IPSLCM6_rc0  LMDZ5/branches/LMDZ6_rc0                  2283      11  LMDZ           modeles
#-C- IPSLCM6_rc0  CONFIG/UNIFORM/v6_rc0/IPSLCM6             HEAD       8  IPSLCM6        config
#-C- IPSLCM6_rc0  trunk/libIGCM                             1174      10  libIGCM        .
#-C- IPSLCM6_rc0  trunk/NEMOGCM                             4859       7  .              modeles
#-C- IPSLCM6_rc0  XIOS/branchs/xios-1.0                      592      12  XIOS           modeles
```

2.1.1. How to use it

Here are the commands you need to know if you want to retrieve and compile the IPSLCM6 model and if you want to setup and run a piControl experiment (only piControl experiment is available):

```
mkdir MONREPERTOIRE ; cd MONREPERTOIRE
svn_ano # svn co http://forge.ipsl.jussieu.fr/igcmg/svn/modipsl/trunk modipsl
cd modipsl/util
./model IPSLCM6_rc0
cd ../config/IPSLCM6
gmake # by default ORCA2xLMD9695-L39
cp EXPERIMENTS/IPSLCM5/EXP00/config.card .
vi config.card # modify JobName (at least) : MYJOBNAME, restarts
../../util/ins_job # Check and complete job's header
cd MYJOBNAME
vi Job_MYJOBNAME # modify PeriodNb, adjust the time, headers ...
llsubmit Job_MYJOBNAME # IDRIS
ccc_msub  Job_MYJOBNAME # TGCC
```

2.1.1.1. Specific command on TGCC Bull Curie thin nodes

The basic configuration (default configuration) uses **160 computing cores** or 10 nodes: 1 process for XIOS, 31 processes for NEMO, and 32 MPI processes and 4 OpenMP thread for LMDZ. You have to modifiy header of the Job script as follow :

```
#MSUB -n 160 # number of cores used by the Job (equal to the total number of process/threads : for example 32x4 + 31 + 1 =
#MSUB -x # Sprecify the node is not shared
#MSUB -E '--cpu_bind=none'
```

2.1.1.2. Specific command on IDRIS IBM Ada

The basic configuration uses **56 computing cores** or 2 nodes: 1 for XIOS, 7 for NEMO, and 24 MPI and 2 OpenMP for LMDZ. You have to modifiy headers of the Job script as follows :

```
# Nombre de processus MPI demandes (ici 24 + 7 + 1 = 32)
# @ total_tasks = 32
# Nombre de coeurs réellement utilisés (ici 24 x 2 + 7 + 1 = 56)
# @ environment = "BATCH_NUM_PROC_TOT=56"
# Nombre de taches OpenMP/pthreads par processus MPI
# @ parallel_threads = 2
```

and config.card as follows :

```
#========================================================================
#D-- Executable -
[Executable]
#D- For each component, Real name of executable, Name of executable for oasis
ATM= (gcm.e, lmdz.x, 24MPI, 2OMP)
SRF= ("" ,"" )
SBG= ("" ,"" )
OCE= (opa, opa.xx  , 7MPI)
ICE= ("" ,"" )
MBG= ("" ,"" )
CPL= ("", "" )
IOS= (xios_server.exe, xios.x, 1MPI)
```

2.1.2. Restart files

IPSLCM6 configuration could restart from any IPSLCM5A, IPSLCM5_v5 and IPSLCM6 restart files. Default configuration starts from IPSLCM5A piControl2pm01 simulation (2349-12-31).

2.1.3. Lenghts, frequencies

2.1.3.1. Period lenght

Default period lenght is 1Y, i.e in config.card :

```
PeriodLength=1Y
```

Note that clean_month.job will remove last period files, i.e last simulated year files.

2.1.3.2. Output frequency

By default, only **monthly outputs** are activated.

2.1.3.3. Pack Frequency

Default pack frequency is 10Y, i.e in config.card :

```
PackFrequency=10Y
```

Note that since clean_year.job works on the latest pack period, clean_year.job will remove files from latest 10Y pack period. clean_year.job can also be used several time in a row to delete several 10Y pack periods.

2.1.3.4. Rebuild frequency

Since we run with XIOS (server mode) as output library, **the rebuild step is not needed anymore**.

2.1.4. Computing centres

2.1.4.1. TGCC Bull Curie thin nodes

Default configuration on **160 cores** allows you to run **38 simulated years per day**. Because of load-balancing (difference between ocean computing time and atmosphere computing time), not all configurations (in terms of number of process/threads) are efficient. If you want to run a configuration with less cores, ask Arnaud Caubel what would be the optimum configuration. The configuration is regularly used and evaluated on this machine: ■■http://webservices.ipsl.jussieu.fr/trusting/

2.1.4.2. IDRIS IBM Ada

Configuration on **56 cores** allows you to run **16 simulated years per day**. This configuration is regularly used and evaluated on this machine: ■■http://webservices.ipsl.jussieu.fr/trusting/

2.1.5. Evaluation

Person in charge: Jérôme Servonnat

2.1.5.1. Results comparaison between TGCC Curie and IDRIS Ada supercomputers

Simulations with default configuration have been performed both on Curie and Ada :

- CTLCM6G on Curie : http://dods.extra.cea.fr/work/p86caub/IPSLCM6/PROD/piControl/CTLCM6G/MONITORING
- CM6VLR1 on Ada : http://dodsp.idris.fr/rces061/IPSLCM6/PROD/piControl/CM6VLR1/MONITORING

2.1.5.2. Results comparaison between IPSLCM5 and IPSLCM6 simulations

Here are simulations performed to validate IPSLCM6-VLR_rc0 configuration :

- **CTLCM6G (default configuration IPSLCM6-VLR_rc0)** : IPSLCM6-VLR_rc0 model (CM6 water routing scheme, pmagic=-0.01, start from 2349-12-31 piControl2pm01)
  - Output and Analyse files : /ccc/store/cont003/dsm/p86caub/IGCM_OUT/IPSLCM6/PROD/piControl/CTLCM6G
- CTLCM6F : IPSLCM6-VLR_rc0 model(CM5 water routing scheme, start from 2499-12-31 piControl2)
  - Output and Analyse files : /ccc/store/cont003/dsm/p86caub/IGCM_OUT/IPSLCM6/PROD/piControl/CTLCM6F
- CTLCM6H : IPSLCM6-VLR_rc0 model (CM6 water routing scheme, pmagic=-0.01, without NEMO TKE IPSLCM5 parameters, start from 3199-12-31 CTLCM6G)
  - Output and Analyse files : /ccc/store/cont003/dsm/p86caub/IGCM_OUT/IPSLCM6/PROD/piControl/CTLCM6H

These simulations have been compared with IPSLCM5 simulations results :

- piControl2 : IPSLCM5A reference simulation
- CTLCM5V5v5 : IPSLCM5_v5 configuration(aerosols v5)
- piControl2pm01 : IPSLCM5A reference simulation with pmagic=-0,01.

Following validation aspects are available :

- Inter-monitoring comparison : http://dods.extra.cea.fr/work/p86caub/INTERMONITORING/intermonit_valid_CM6A_VLR_rc0
- Metric table

Root-Mean-Square Error calculated on the seasonal cycle over the globe (land + ocean) against two different references for each variable. This metric synthesizes the bias (difference in mean), the spatio-temporal correlation and standard-deviation ratio. The results are presented in % of the mean RMSE of piControl2 => a result of -10% indicates that the RMSE is 10% lower than the average RMSE of the reference simulation (here, five seasonal cycles of piControl2) ; the blue color shows the RMSE that are lower (in better agreement with the reference dataset) than the reference simulation. Inversely, the red color indicates a degradation compared with the reference simulation. For each simulation, the RMSE are shown for several seasonal cycles to illustrate the interannual/decadal variability of the results.

The table shows that :

- CTLCM5V5v5 has similar results as piControl2 (less than 5%) ; this suggests that CM6A-VLR_rc0 (with new water routing scheme and same p_magic as CM5A-LR) simulates a climate that is very similar to IPSL-CM5A-LR
- Same for CTLCM6F

- CTLCM6G and CTLCM6H (IPSLCM6A-VLR_rc0 with new water routing scheme and p_magic = -0.01) and piControl2pm01 (p_magic = -0.01) show a reduction of the error on the 2m-temperature (tas) of around 15%, very likely associated with the adjustment of albedo (p_magic = -0.01)
- For those simulations, we also note a degradation of the LW up (rlut and rlutcs) between 5 and 10% (greater than the variability among the seasonal cycles of piControl2), probably linked with the p_magic (mainly concerns the tropics, not shown); in the same time, the SW gets significantly better (around 5%)
- For CTLCM6G and CTLCM6H, we also see a slight degradation of the zonal wind at 10m (uas), of the same order as the LW ; looking at the RMSE tables for the different seasons and regions, we can see that this degradation mainly concerns the tropics (-20/20°N) and the extra-tropical southern hemisphere
- For the other variables, the results do not show significant differences between piControl2 and IPSLCM6A-VLR_rc0 (with the new water routing scheme and p_magic = -0.01, simulations CTLCM6G and CTLCM6H)

Conclusion:

- the evalution metrics of the seasonal cycle of IPSLCM6A-VLR_rc0 with the water routing scheme of CM5A and the same p_magic are similar to the ones obtained for piControl2. This suggests that the model is the same.
- the new water routing scheme and the tuned p_magic produce a climate that is in better agreement for IPSLCM6A-CLR_rc0 compared with IPSLCM5A-LR for tas and the SW; we note a degradation of the LW and the zonal winds; with the new water routing scheme and p_magic = -0.01, we can say that IPSLCM6A-VLR_rc0 is not the same as CM5A-LR. Further assessment is needed to understand what's happening with the radiative variables.
