

# Evaluation of Trunk version simulated hydrology over Siberia

S. Dantec-Nédélec,  
C. Ottlé, F. Maignan..

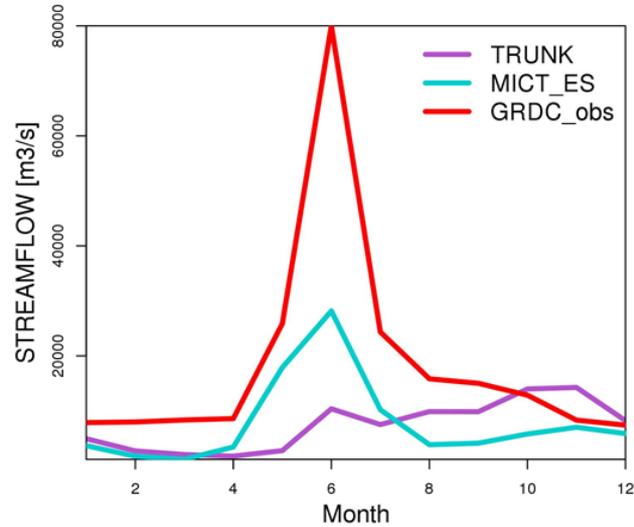

- Orchidee versions comparison :
  - Standard Orchidee configuration (Trunk)
  - Trunk-ES (with the soil freezing and 3L snow)
- Forcing data : WFDEI (1979-2009) : “WATCH Forcing Data methodology applied to ERA-Interim data”
- SPINUP : 100 years (1979-1988)\*10
- 3 watersheds (Ob, Yenessei, Léna) with different snow and permafrost conditions

# Streamflows evaluation against GRDC database (outlet stations)

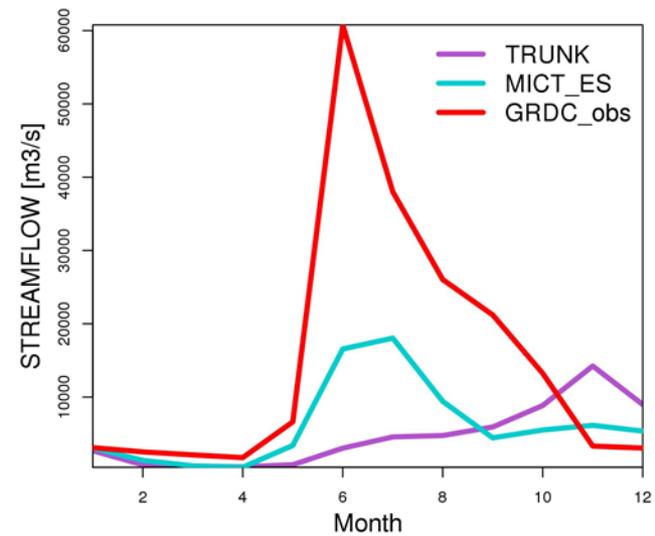

Ob(1979-1994) monthly average

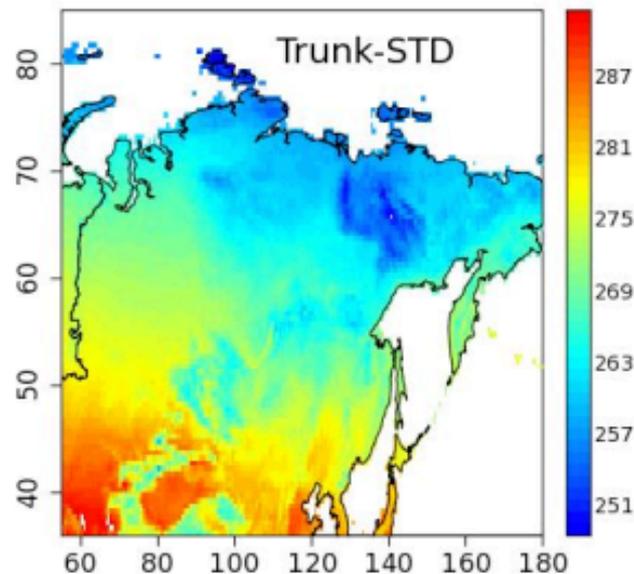

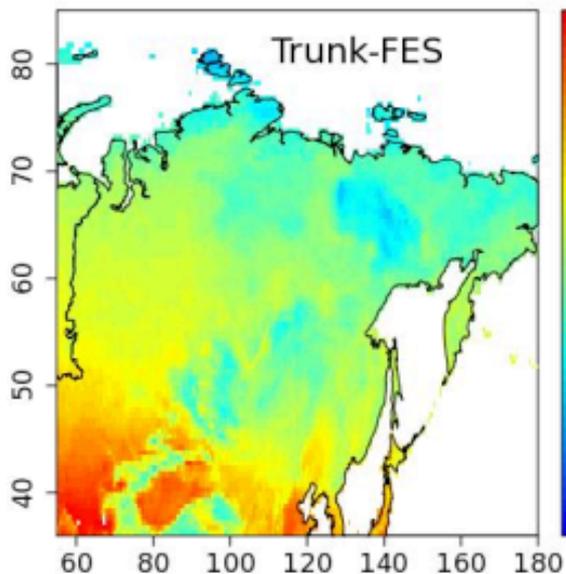

Yenesei(1979-1994) monthly average

Lena(1979-1994) monthly average

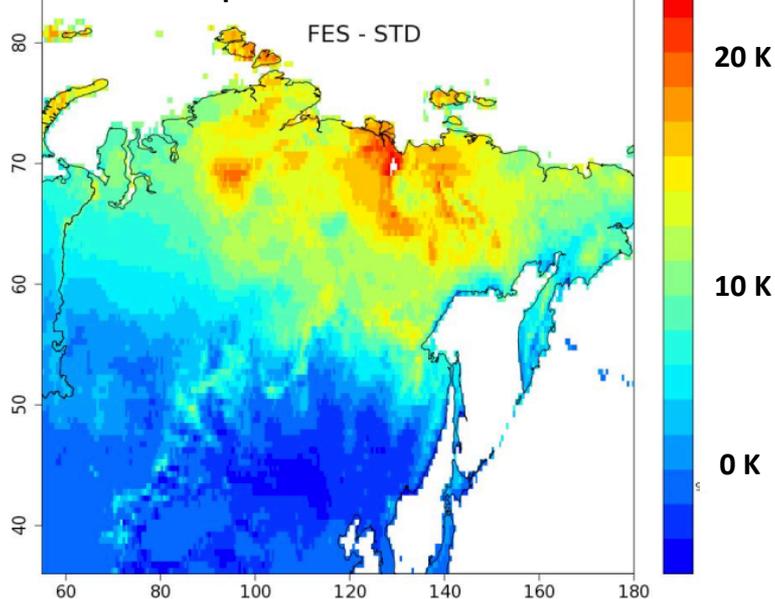

# Temperature on the 11 layers [1979-2009] (K)

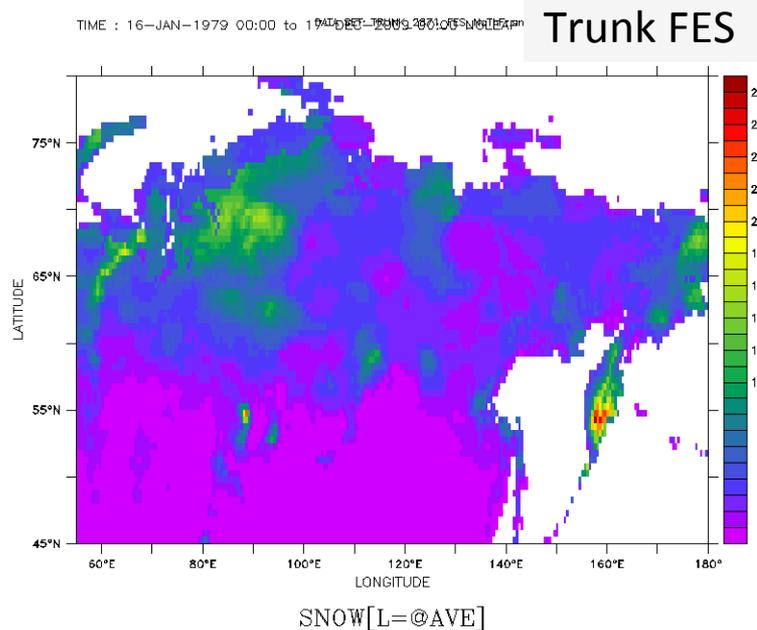

Soil is warmer in FES version and the differences seem correlated with snow cover

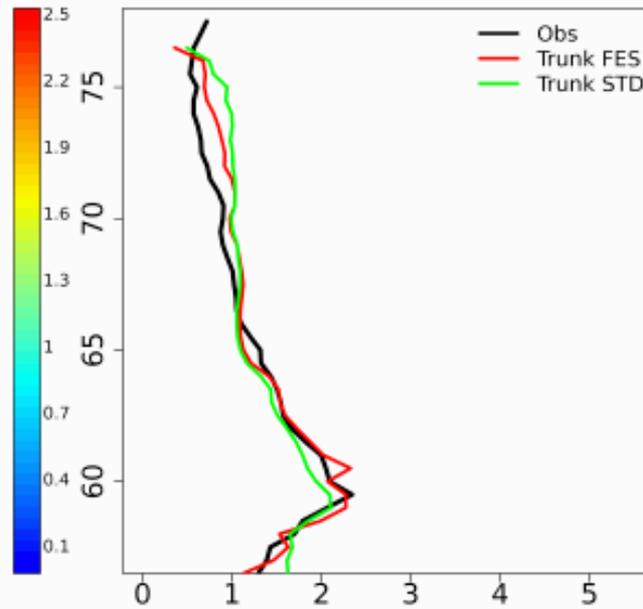

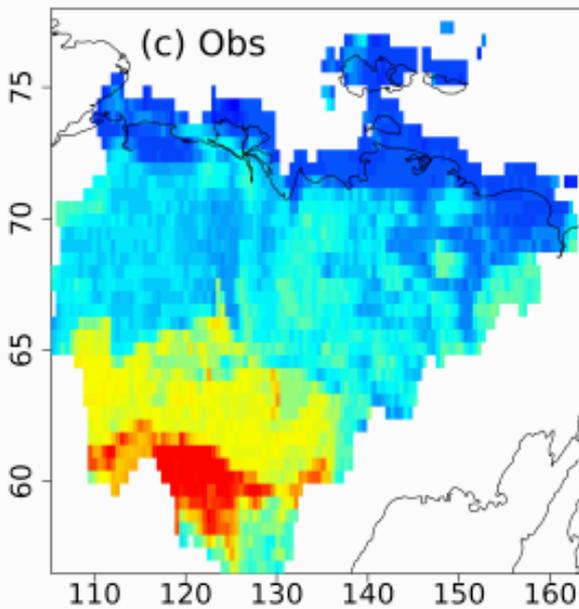

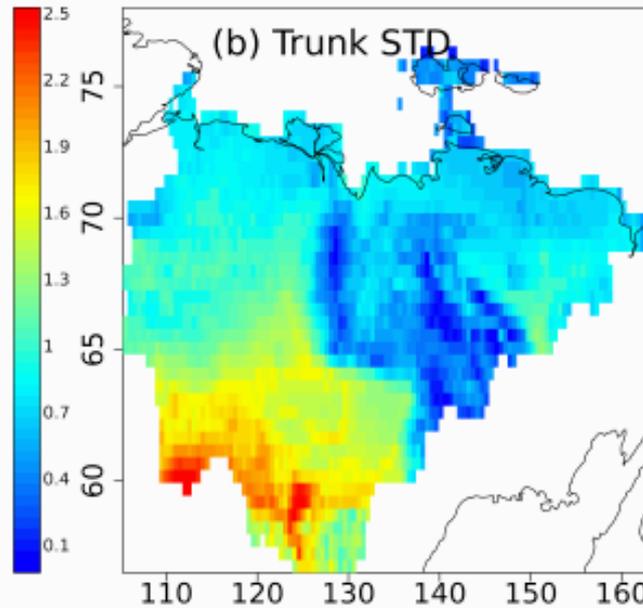

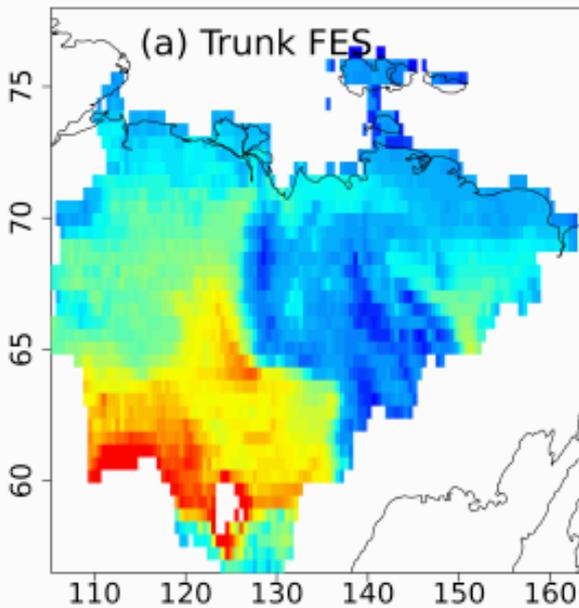

## Soil temperature differences

TIME : 16-JAN-1979 00:00 to 15-DEC-2009 00:00 (5501.500000000000)

# Active layer thickness (1979-1987)

Trunk FES = Trunk version (n°2871) Freeze & Explicit Snow activated

Trunk STD= Trunk version (n°2871) standard configuration

Simulated ALT, closer to the observations with FES version
